

Web Development Using Application Frameworks Instructions for the Final Project

General Description

You will be expected to plan, gather requirements for, design, code, and test a Web application using Django as your Final Project. Expectations include:

- The Web application should fully demonstrate the Django application framework features covered in the class. These include:
 - Django models
 - Django URL configurations
 - Django views (including class-based views and generic class-based views)
 - Django templates
 - Django user authentication and permission schemes
- The Web application should include significant database add/change/delete functionality.
- The Web application should be sufficiently interesting to you that you are likely to continue to develop and maintain it after the course is complete.

More details regarding project expectations are presented below.

Project Size

The size of the project should be comparable to the size of the completed EZU tutorial project. Size will be assessed based upon Django Function Points. The formula for Django Function Points is:

number of model classes + number of URL patterns

Using the formula above, the completed EZU tutorial project has a Django Function Point score of 44.

Nature of the Application

Provided that you meet the other expectations for the project, you have fairly wide latitude regarding the nature of the application. Whatever application you choose, please make sure that it has a significant database component.

Design and Coding

The design and coding of your project should be consistent with the standards and practices presented in the Pinkham text and demonstrated in the EZU tutorial example.

How Important is Creativity

The grading of your final project will be based upon the grading rubric document which will be published separately in our Weekly Schedule. Please consult this document for details of the grading scheme.

Creativity is important on this project in that it may help to keep your interest in the project high. Designing a novel application, providing interesting features, providing remarkably high usability, or including dramatic styling are all ways to express yourself and increase your own commitment to this work. So, if you wish to include these in your project, you might expect them to increase your own satisfaction.

Nevertheless, you should be aware that there are no explicit points allocated in the grading rubric for such a level of creativity. Your application doesn't need to represent a promising business opportunity such that it might be the new Facebook or the new Google. It doesn't need to demonstrate important knowledge of other coursework from the iSchool like machine learning or natural language processing. It doesn't need to provide substantially more usability than that provided in the EZU tutorial example. And it definitely does not need to have better styling than the EZU tutorial example.

When you examine the grading rubric, you will see that points are awarded for building an application that is comparable to the EZU tutorial example in its size, scope, completeness, and professional build quality. As stated above, please refer to the grading rubric document for details of the grading scheme.

Tools

I am expecting you to use the tools that we have been using throughout the semester: Anaconda, PyCharm, and Git.

Tool Versions

In the current semester, I am expecting you to use Python 3.8 and Django 3.1. If you are considering a final project configuration that would require a different version of Python, a different version of Django, or that requires the installation of further packages, please get my permission before making this choice. In the case that I do approve a different virtual environment, you will need to submit a *requirements.txt* file with your project that we can use to properly create a virtual environment with which we will test your project.

Testing

Your application should be fully tested when submitted. Since we did not cover automated testing methods in the course, you will not be expected to have used automated testing tools. Testing by exercising the application and inspecting output is sufficient.

Documentation

In order to properly evaluate your submission, we will need for you to provide us with documentation. This single document should be placed within your Django project in the same directory as your *settings.py* file and named:

README.PDF

This README.PDF document should include enough information for us to properly evaluate and grade your submission. It should include at least the following:

1. If I have approved a different virtual environment for your project (see above), then you must provide a *requirements.txt* file and instructions for building the virtual environment that we will use to test your work.
2. A short description of your application and its intended user communities. This includes both regular users and administrative users.
3. A description of the authentication and permissions scheme that you have implemented and how it corresponds to the communities described above. A table of user groups and permissions assigned to user groups should be included.
4. Lists of user IDs and passwords with an explanation of how they map to the communities described above. At a minimum, your application should have a user defined named *tester* that has a password of (*secret*).
5. Instructions for testing your application using the sufficient test data, user IDs, and passwords that you have provided.
6. Any further information that will help us understand your application for the purposes of fairly and fully evaluating it.

Format

Submit 1 file with of type .ZIP.

Submission

Please note that the name of the file submitted and the name of your PyCharm project directory must be in all lower case. Deductions will be made for submissions that do not follow this standard.

Zip up your PyCharm project directory and submit that zip file to the submission activity identified for this assignment in the Weekly Schedule.

When submitting your project files, please use the following naming conventions:

- Name your PyCharm project directory using the following naming pattern:

`surname_givename_final_project`

If this were my project, I would name it:

`trainor_kevin_final_project`

- Consequently, the zip file that you submit will have the following naming pattern:

`surname_givename_final_project.zip`

If this were my project file, I would name it:

`trainor_kevin_final_project.zip`

Submission Deadline

The submission deadline and submission activity will be indicated in the Weekly Schedule.

Grading

A separate grading rubric document will be posted to the Weekly Schedule.
