IS594-PJ Project Management
Instructions for Team Presentation Video

Exercise 1 (Regular) – Team Presentation Video

Assignment Overview
Your team is expected to create a presentation video for your project consistent with this instructions document. While this presentation includes a demonstration of the product(s) of your project, you will be expected to address several other important issues during the presentation. So, **please read all of these instructions before you record your presentation video**. You are expected to post your presentation videos to a streaming video site like YouTube. So, you will be submitting the URL for the presentation video rather than a video file. Please read all of the instructions below for more details regarding expectations for the presentation.

Number and Length of Video Files
One video should be submitted that is up to 40 minutes in length. Shorter videos will be viewed and graded. Nevertheless, it will be difficult to earn all of the points available with too brief of a video

Your video may be edited such that it is composed of more than one recording. Nevertheless, we will only play one video file when grading. So, please do not submit multiple videos.

Submission Method
A Canvas assignment activity will be provided for the submission. Each team is expected to submit only one URL for their video. This means that the team will need to load their video onto a streaming service like YouTube before submission. Which video streaming service the group chooses does not matter. The URL submitted must play the video in the Chrome browser running on Windows 10, Windows 11 or macOS.

Tools
Your team is free to use whatever video recording tools that you wish.

Video Content
We will be using your video presentation to evaluate your project management work. So, begin by reviewing your understanding of the scope, schedule, cost, and requirements for the project.

This video is your opportunity to show the outcome of your project. If this project created a working information system, then make sure to include a demo of the system and a tour of the code. If this project created the requirements and design for an information system, then include a tour of the documents that your delivered to the

client to represent those products. If this project produced some product or service other than an information system, then include a tour of the product or service.

Here are some issues that you might address in your presentation:

- Who is the client?
- What problem are we trying to solve, or what opportunity are we trying to capitalize upon?
- What product or service did your project produce.
- Who will be using the product or service produced by the project.
- If this is an information system, what use cases or user stories are implemented by the system.
- If this is an information system, what is its conceptual data model.
- If this is an information system, what are its non-functional requirements.
- Is this the final destination for your client? Or, are further projects needed to get your client to where they intend to go.

Participants
Your video should include at least 2 members of your team. Please see Exercise 2 for more options regarding video participants.

Exercise 2 (Challenge) - All Team Member Participate in Video
Teams who include all team members as presenters in their video will qualify as having completed the Challenge Exercise for this assignment.

Due By
The due date and time are shown in the Weekly Schedule.

Grading
A separate grading rubric document will be posted to the Weekly Schedule.
