Chapter 5

How to insert, update, and delete data

Objectives

Applied

- 1. Create a copy of a table that can be used for testing INSERT, UPDATE, and DELETE statements.
- 2. Given the specifications for an action that modifies data, code the INSERT, UPDATE, or DELETE statement for doing the action.

Knowledge

- 1. Describe MySQL's default behavior when you execute an INSERT, UPDATE, or DELETE statement.
- 2. Explain how to handle null values and default values when coding INSERT and UPDATE statements.

The syntax of the CREATE TABLE AS statement

CREATE TABLE table_name AS select_statement

Create a complete copy of the Invoices table

```
CREATE TABLE invoices_copy AS
SELECT *
FROM invoices
```

Create a partial copy of the Invoices table

```
CREATE TABLE old_invoices AS
SELECT *
FROM invoices
WHERE invoice_total - payment_total - credit_total = 0
```

Create a table with summary rows from the Invoices table

```
CREATE TABLE vendor_balances AS

SELECT vendor_id, SUM(invoice_total) AS sum_of_invoices

FROM invoices

WHERE (invoice_total - payment_total - credit_total) <> 0

GROUP BY vendor_id
```

Delete a table

DROP TABLE old_invoices

The syntax of the INSERT statement

The column definitions for the Invoices table

invoice_id	INT	NOT	NULL
	AUTO_INCREMENT	,	
vendor_id	INT	NOT	NULL,
invoice_number	VARCHAR (50)	NOT	NULL,
invoice_date	DATE	NOT	NULL,
invoice_total	DECIMAL(9,2)	NOT	NULL,
payment_total	DECIMAL(9,2)	NOT	NULL
_	DEFAULT 0,		
credit_total	DECIMAL(9,2)	NOT	NULL
_	DEFAULT 0,		
terms_id	INT	NOT	NULL,
invoice_due_date	DATE	NOT	NULL,
payment_date	DATE		

Insert a single row without using a column list

```
INSERT INTO invoices VALUES
(115, 97, '456789', '2022-08-01', 8344.50, 0, 0, 1,
'2022-08-31', NULL)
(1 row affected)
```

Insert a single row using a column list

```
INSERT INTO invoices
        (vendor_id, invoice_number, invoice_total, terms_id,
        invoice_date, invoice_due_date)
VALUES
        (97, '456789', 8344.50, 1, '2022-08-01',
        '2022'-08-31')
(1 row affected)
```

Insert multiple rows

```
INSERT INTO invoices VALUES
     (116, 97, '456701', '2022-08-02', 270.50, 0, 0, 1,
     '2022-09-01', NULL),
     (117, 97, '456791', '2022-08-03', 4390.00, 0, 0, 1,
     '2022-09-02', NULL),
     (118, 97, '456792', '2022-08-03', 565.60, 0, 0, 1,
     '2022-09-02', NULL)
(3 rows affected)
```

The column definitions for the Color_Sample table

INSERT statements for the Color_Sample table

```
INSERT INTO color_sample (color_number)
VALUES (606)

INSERT INTO color_sample (color_name)
VALUES ('Yellow')

INSERT INTO color_sample
VALUES (DEFAULT, DEFAULT, 'Orange')

INSERT INTO color_sample
VALUES (DEFAULT, 808, NULL)

INSERT INTO color_sample
VALUES (DEFAULT, DEFAULT, NULL)
```

The Color_Sample table with the inserted rows

	color_id	color_number	color_name
•	1	606	NULL
	2	0	Yellow
	3	0	Orange
	4	808	NULL
	5	0	NULL

The syntax for using a subquery to insert one or more rows

```
INSERT [INTO] table_name [(column_list)]
select_statement
```

Insert paid invoices into the Invoice_Archive table

```
INSERT INTO invoice_archive
SELECT *
FROM invoices
WHERE invoice_total - payment_total - credit_total = 0
(103 rows affected)
```

The same statement with a column list

```
INSERT INTO invoice_archive
    (invoice_id, vendor_id, invoice_number,
    invoice_total, credit_total, payment_total,
    terms_id, invoice_date, invoice_due_date)

SELECT
    invoice_id, vendor_id, invoice_number,
    invoice_total, credit_total, payment_total,
    terms_id, invoice_date, invoice_due_date

FROM invoices

WHERE invoice_total - payment_total - credit_total = 0

(103 rows affected)
```

The syntax of the UPDATE statement

```
UPDATE table_name
SET column_name_1 = expression_1
  [, column_name_2 = expression_2]...
[WHERE search_condition]
```

Update two columns for a single row

```
UPDATE invoices
SET payment_date = '2022-09-21',
    payment_total = 19351.18
WHERE invoice_number = '97/522'
(1 row affected)
```

Update one column for multiple rows

```
UPDATE invoices
SET terms_id = 1
WHERE vendor_id = 95
(6 rows affected)
```

Update one column for one row

```
UPDATE invoices
SET credit_total = credit_total + 100
WHERE invoice_number = '97/522'
(1 row affected)
```

Safe update mode in MySQL Workbench

- By default, MySQL Workbench runs in safe update mode.
- Safe update mode prevents you from updating rows if the WHERE clause is omitted or doesn't refer to a primary key or foreign key column.
- You can turn safe update mode off by selecting Edit→Preferences, selecting the SQL Editor node, unchecking the "Safe Updates" option, and restarting MySQL Workbench.

Warning

• If you turn off safe update mode and omit the WHERE clause in an UPDATE statement, all rows in the table will be updated.

Update all invoices for a vendor

```
UPDATE invoices
SET terms_id = 1
WHERE vendor_id =
    (SELECT vendor_id
    FROM vendors
    WHERE vendor_name = 'Pacific Bell')
(6 rows affected)
```

Update the terms for all invoices for vendors in three states

```
UPDATE invoices
SET terms_id = 1
WHERE vendor_id IN
   (SELECT vendor_id
   FROM vendors
   WHERE vendor_state IN ('CA', 'AZ', 'NV'))
(40 rows affected)
```

The syntax of the DELETE statement

```
DELETE FROM table_name
[WHERE search condition]
```

Delete one row

```
DELETE FROM general_ledger_accounts
WHERE account_number = 306
(1 row affected)
```

Delete one row using a compound condition

```
DELETE FROM invoice_line_items
WHERE invoice_id = 78 AND invoice_sequence = 2
(1 row affected)
```

Delete multiple rows

```
DELETE FROM invoice_line_items
WHERE invoice_id = 12
(4 rows affected)
```

Use a subquery in a DELETE statement

```
DELETE FROM invoice_line_items
WHERE invoice_id IN
    (SELECT invoice_id
    FROM invoices
    WHERE vendor_id = 115)

(4 rows affected)
```

Warning

• If you turn safe update mode off and omit the WHERE clause from a DELETE statement, all the rows in the table will be deleted.
